Q&A

Galaxy is great for:

- NGS Analysis
- Assembly
- ...
- Annotation Analysis (Tabular processing, etc)
- *omics

But we are missing the Annotation step.

We are missing the tooling, the trainings, and the community for genome annotation.

Production Ready

docker-galaxy-genome-annotation

[Contributors](#) [Source](#) [MIT License](#)

Galaxy Docker repository with tools for Genome Annotation. The image is built with tools for Assembly (Spades, Mira), Structural Prediction (Glimmer, Augustus), Functional Prediction (BLAST+, InterProScan, BLAST, Diamond, Blast2GO), various Utilities (PASTA manipulation tools, EMBOSS), tools for Comparative Genomics (CD-HIT, ClustalW, ArmitSmash, mummer), and finally Annotation & Visualization tools (Apollo Tools, JBrowse-in-Galaxy, JBrowse-in-Galaxy Extras, Tripal Admin tools, Circos)

dockerized-gmod-deployment

[Contributors](#) [Source](#) [GNU General Public License v3.0](#)

If customizing the docker-galaxy-genome-annotation image isn't your style, this is a preconfigured deployment of Galaxy + Apollo + Chado + Tripal + JBrowse + JBrowse REST API + PostGraphQL + JBrowse GraphQL Experiment all as a docker-compose.yml

python-apollo

[Contributors](#) [Source](#) [MIT License](#)

Python library for talking to Apollo API. This includes the experimental Arrows Apollo client.

galaxy-tools

[Contributors](#) [Source](#) [MIT License](#)

Structural Annotation

For the genome annotation we use a piece of the *Aspergillus fumigatus* genome sequence as input file.

Sequence Features

First we want to get some general information about our sequence.

Hands-on: Sequence composition

1. Count the number of bases in your sequence (compute sequence length)
2. Check for sequence composition and GC content (gccontent).
3. Plot the sequence composition as bar chart.

```

# Sequence composition
len(s)
# 1000000
gccontent(s)
# 0.500000

```

Complete Genome Sequence of *Klebsiella pneumoniae* Carbapenemase-Producing *K. pneumoniae* Myophage Miro

Eleni M. Mijalis, Lauren E. Lessor, Jesse L. Cahill, Eric S. Rasche, Gabriel F. Kutry Everett

Center for Phage Technology, Texas A&M University, College Station, Texas, USA

Klebsiella pneumoniae is a Gram-negative pathogen frequently associated with antibiotic-resistant nosocomial infections. Bacteriophage therapy against *K. pneumoniae* may be possible to combat these infections. The following describes the complete genome sequence and key features of the pseudo-T-even *K. pneumoniae* carbapenemase (KPC)-producing *K. pneumoniae* myophage Miro.

Received 19 August 2015 Accepted 19 August 2015 Published 1 October 2015

Citation Mijalis EM, Lessor LE, Cahill JL, Rasche ES, Kutry Everett GF. 2015. Complete genome sequence of *Klebsiella pneumoniae* carbapenemase-producing *K. pneumoniae* myophage Miro. *Genome Announc* 3(5):e01137-15. doi:10.1128/genomeA.01137-15.

Klebsiella pneumoniae carbapenemase (KPC)-producing *K. pneumoniae* is a highly drug-resistant bacterium in the family *Enterobacteriaceae*. It can easily be spread in hospital settings, provoking deadly systemic infections (1, 2). This gives credibility to the prospect of bacteriophage-based therapy against the pathogen. Here, we describe the complete genome of pseudo-T-even myophage Miro.

opened to the *rlb* gene, whose start codon overlaps with the stop codon of *rla*, such that the two genes cannot be separated, a common feature of pseudo-T-even phages (11). Miro is closely related to *Klebsiella* phage KP15 (accession no. NC_014036), with which it shares 94.5% nucleotide sequence identity across the genome. It also shares 92.9% nucleotide sequence identity across the genome with *Klebsiella* phage KP27 (accession no. NC_020080),
